
Demo = age, sex, index year; ECG = 32 PCs of the pre-index ECG embedding; CLMBR-T = 64 PCs of a foundation-model embedding of the coded pre-index EHR. Labels: paired differences;
two-sided sign-flip P across 31 trials, unadjusted. † PS-Clinical without LVEF (5-draw MI). The gains are not trial-specific (benchmark-permutation P = .26 for Demo + ECG + CLMBR-T vs PS-CVD5, two-sided).
